

School Management System

PROJECT STATEMENT

PROBLEM:

The problem currently faced by many schools is the management of course delivery. There is no such system that holds the data of the student from the admission to the passing out.

Sometimes the teacher doesn't properly handle the workload and a number of students are not able to follow the course effectively.

OBJECTIVE:

The common objective was to provide a cost effective tool to improve the capacity of school to measure and report the student achievement.

The overall objective is to improve student performance through information provided by the system. This system is best to create communication between students, teachers, and administration.

The main problem of principal is not aware of number of student's. The students don't get to know about events of the school on time.

To help promote students achievement and success, schools must have access to complete, accurate, and timely information about students.

Attendance of the students is recorded by the teacher. In order to control absentees and know the number of days that a student has been absent from the school during the schools days the attendance officer has to collect the attendance slips from the corresponding homeroom teachers and compile which is also a time taking process. In addition to that retrieve record of students who have left the institution a couple of years ago has been a difficult task with the manual system. It also has the difficulty producing different reports which are required by various administrators or officials.

Teachers may want to associate a student with his parent or emergency persons for a disciplinary measure which need searching of the student record in the record office.
